

GDPR Data Protection

A service that specifically ensures data archiving and protection in line with the General Data Protection Regulation

At StorEasy we provide a completely new Cloud Storage Service that integrates smoothly with on-premise infrastructure without changing either the applications or the way users access them.

StorEasy offers a service that specifically ensures data archiving and protection in line with the General Data Protection Regulation - UE 2016/679.

GDPR imposes new rules on companies, government agencies and non-profit organizations or other entities that offer products and services to people who reside in the European Union or which collect and analyze data correlated with EU citizens.

Data protection is our corporate mission

We offer exclusive state-of-the-art data archiving and protection services, technologies and solutions. At StorEasy we do not simply offer cloud storage space to our customers. Our approach consists in understanding the authentic value of information to the business and activities of organizations in order to provide our clients with a real and measurable competitive advantage.

We offer a secure and affordable cloud storage platform for data archiving

The protection process offered by StorEasy complies with the strictest national and international regulations covering sensitive data archiving, document management, electronic record storage and log file archiving.

This service guarantees secure and lasting validity of archived data that is binding on third parties thanks to full compliance with the requisites of law. A retention period is established for each bucket. Depending on the specific needs, this period can be set to expire after a certain number of months or years, or never for permanent retention. The data stored in StorEasy is protected from ransomware, malware, viruses and trojans. Data that can be stored for long periods, sometimes decades, thanks to the use of exclusive methodologies, technologies and solutions.

At StorEasy we offer a highly resilient next generation platform to archive unlimited quantities of documents/data at a fraction of the cost of traditional data archiving solutions.

We provide companies with an economically advantageous way to historicize large quantities of files, limiting access to the data or immediately restoring it on demand, thus fulfilling the Right to restriction of processing (Article 18).

WORM technology provides legally compliant log file archiving ensuring that the files cannot be altered, meeting the criteria on security of processing (Article 32).

Data conservation policies can be configured to satisfy the principle of limited conservation (Article 5), where data can be kept for no longer than is necessary for the purposes for which the personal data are processed.

The 3-2-1 archiving strategy meets the requisite of availability and resilience (Article 32), at least for the information contained in the files (there is a broader requirement involving the systems, but this is an important first step).

The high availability architecture guarantees compliance with the requirement of data availability, including business continuity (Article 32).

The ability to selectively delete regarding a specific data subject meets the provision on the Right to be forgotten (Article 17).

The ability to rapidly access historicized data on a data subject addresses the Right to portability (Article 20), enabling recovery of any information provided to the data controller (which may not necessarily reside in a DB).

KMIP support to manage data encryption keys fully satisfies the right to data confidentiality (Article 32) at the same time providing optimum protection against data breaches (Article 33).

We make available innovative cutting-edge storage technologies and solutions and specialist skills to guarantee GDPR-compliant archiving.
